

ADVANCED TECHNOLOGY FOR STONE PROCESSING

Pavoni Automazioni does not miss the appointment with Marmomac 2022. The company has always stood out for the offer of innovative quality CNC and for punctual and efficient after-sales support.

The production line started over 25 years ago and includes horizontal and vertical machines, MIRAGE and STRONG series, and VERTICAL PLUS series, for processing marble and granite. The vertical machines, patented and pride of the company, are well appreciated all over the world for the possibility of processing oversized plates despite their reduced dimensions, for the simplicity of setting up and loading, and last but not least, for the comfort and safety of the operator.

The most representative models of the range will be really working at the fair: they are superior quality machines for strength and ease of use, with treated steel frames up to 12 mm thick, which thanks to their ability to absorb vibrations, makes them particularly suitable to the processing of hard materials such as granite and the like.
